

In electromagnetic phenomenon of the electron spin right and or left are associated with opposing forces - Lenzing . Further examination reveals that the electro spin results in a heat death for it's flux resulting from resistivity - ohm's law . In this case attenuation - decrease only is possible . Not so with the magnetic flux which freely amplifies when resonate , based upon the Fibonacci series . We see this in radio devices when the cycles per seconds velocity changes , for example going upward at about 20,000. CPS radio frequency takes over and the resonate magnetic flux is airborne . At 200,000. CPS the Earth's gravitational field is defeated . Above that upwards into the Megahertz the Van Allen Radiation Belt reflects the upward radiation back towards the Earth . Beyond that the resonate magnetic flux enters space and continues onward for great distances . Examples would be radio communication between the Planets . The visible Sun Lite is an obvious source of resonate magnetic flux . Audible sound is the same phenomenon at a much lower frequency .

This electron spin mechanism is present in weather systems such as high and low pressure areas and world wide where mineral and chemical differences exist . One obvious example would be a tornado . Resonate radiation of Solar Plasm from - by Sun then causes the Earth to spin - rotate . The Ambient Energy Background for the Earth is then obtained since we know the speed [being 1,000. MPH] and the weight of the Earth . This converts into HP and WATTS .

Aerial Magnetometers flown over areas of diverse geology such the mountainous areas in Colorado , when corrected for height flown at yield magnetic flux equivalent of greater than 2 billion volts in electrical flux . The interesting possibility here is , since the function of transformers is changing magnetic flux into electrical flux , that a convent way of harvesting this energy be utilized .
